Precautions when installing or updating on Orin NX

Users who purchased after October 17, 2025 can skip this tutorial; customers who purchased before October 17, 2025 must pay particular attention:

If you need to run the **upgrade** command or click the pop-up window to update the system, the following commands must be executed before running it, otherwise the system will not boot after the update.

```
sudo apt update
sudo apt install cpio
```

After running the above commands, perform the upgrade.

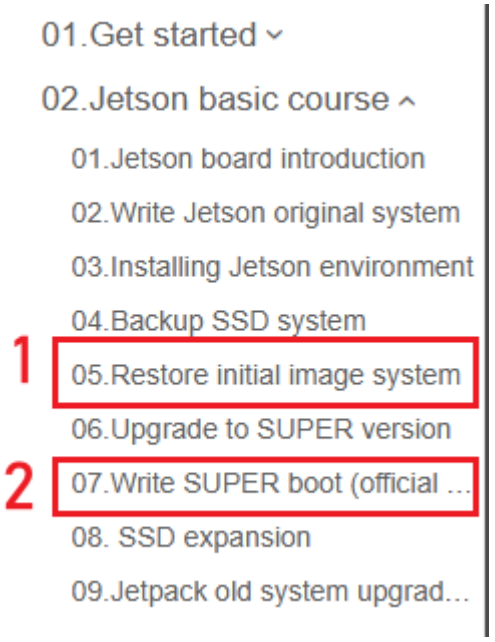
```
sudo apt upgrade
sudo apt-get upgrade
```

2. If the desktop pop-up window prompts you to update the system and you clicked install, you need to run the following commands **before the system shuts down and reboots**, otherwise the system will not boot after the reboot.

```
sudo apt update
sudo apt install cpio
sudo apt upgrade
```

Solution for a system that will not boot after the update:

1. If you want to keep using our image, first refer to item ①, prepare an SSD enclosure yourself and flash the SSD image again. If the system still will not boot after reflashing the SSD image, refer to item ② and flash the super bootloader. Finally check whether it boots.



2. If you do not want to use our image, you can flash the official clean image by referring to the tutorial below. However, the clean image contains no environment at all and cannot be used with our tutorials directly.
