SSD expansion

SSD expansion

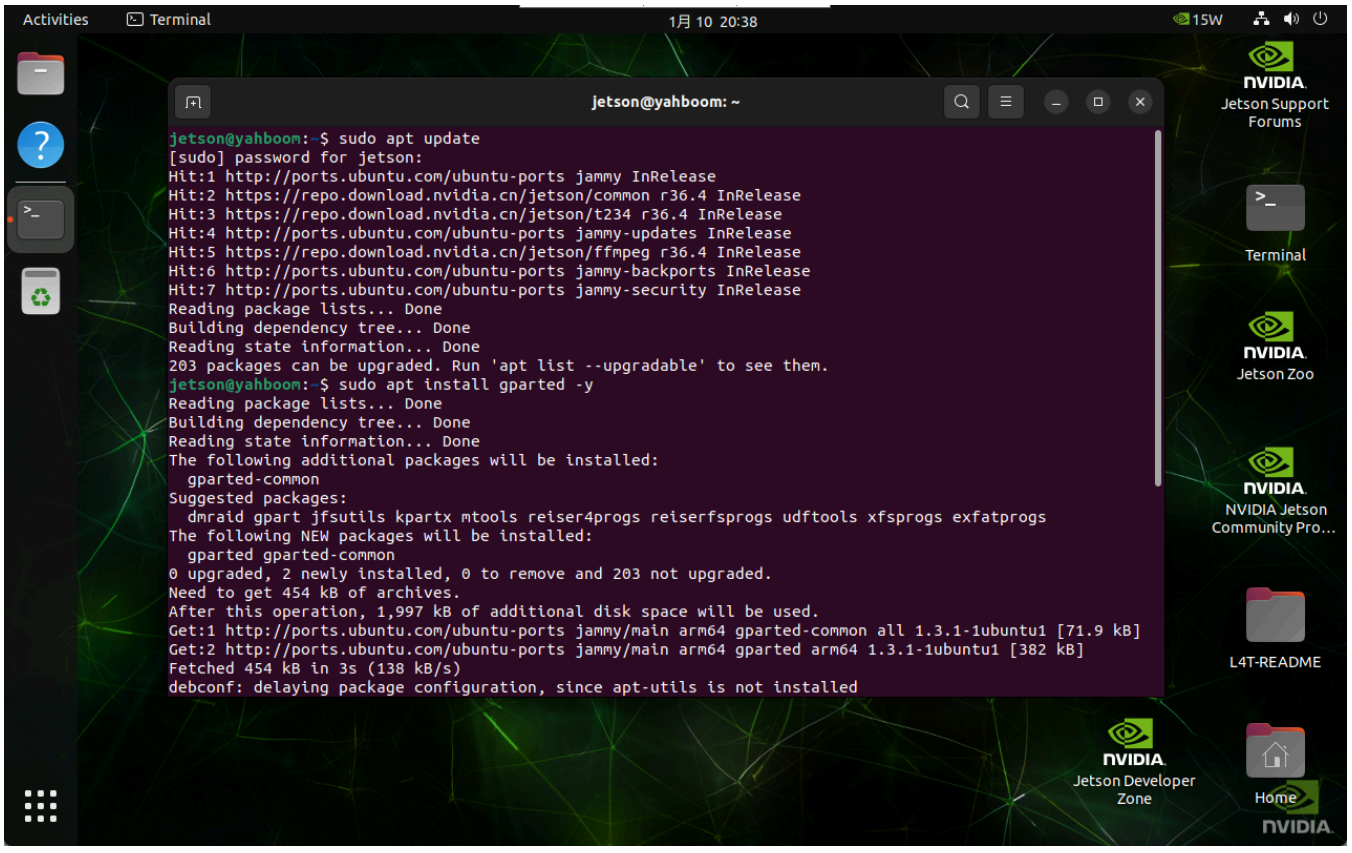

1. Install GParted
2. Use GParted
3. Adjust the partitions

The factory image system performs disk compression, so the capacity displayed inside the system is inconsistent with the actual capacity; users can expand the SSD by following this tutorial.

```
The tutorial is performed inside the Jetson Orin mainboard system
```

1. Install GParted

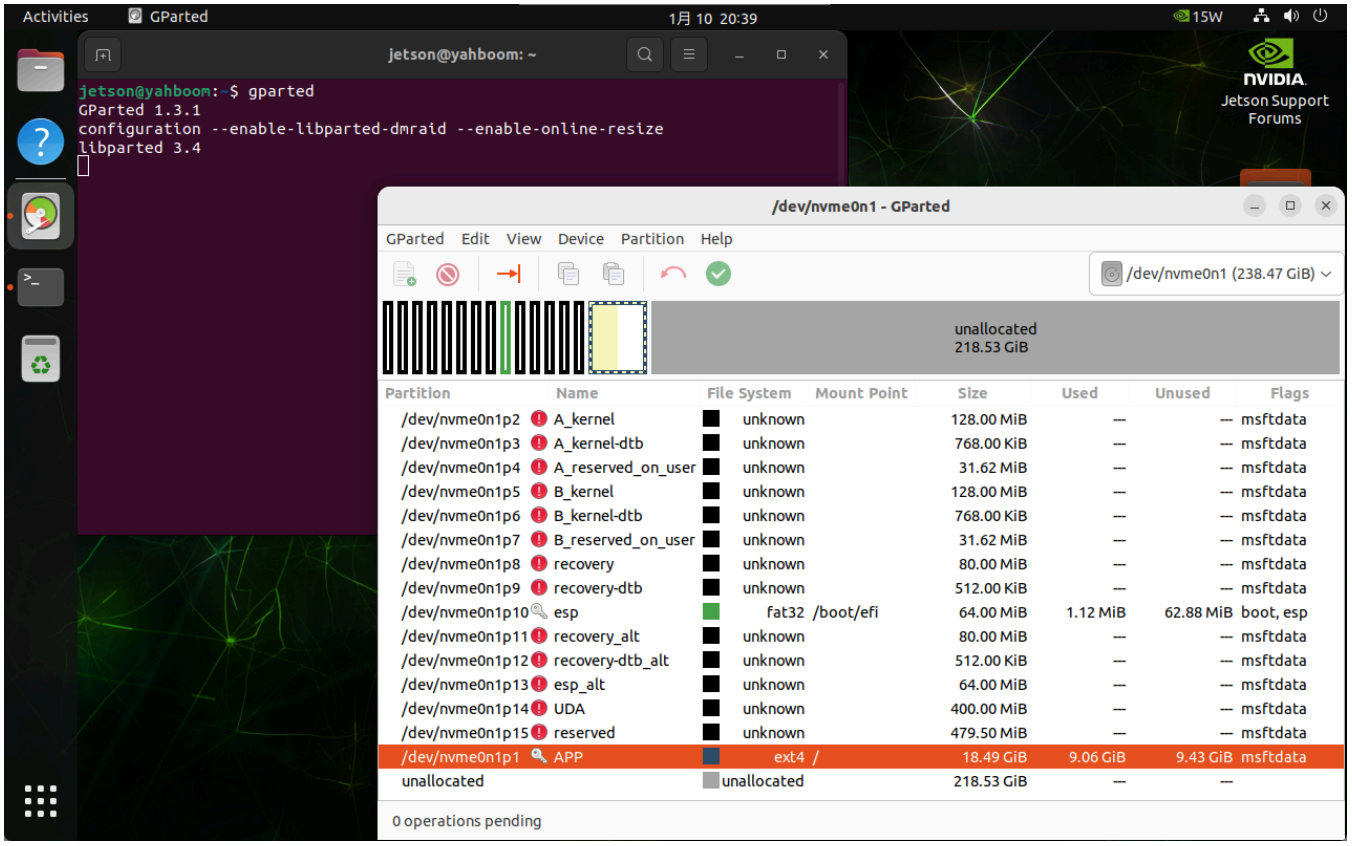

```
sudo apt update
sudo apt install gparted -y
```

2. Use GParted

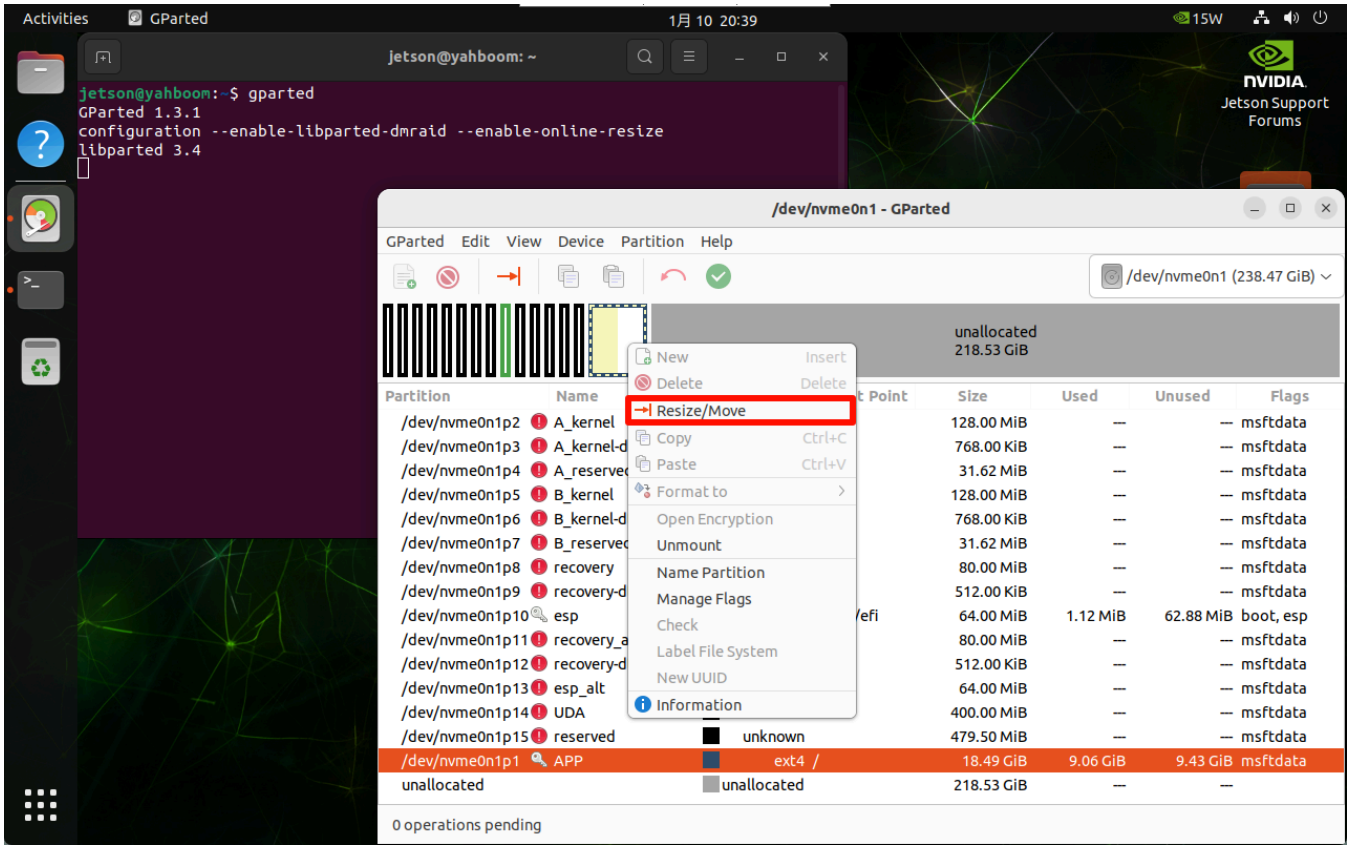

Find the `GParted` application icon in the system application menu bar and open it, or enter the following command in the terminal to start it:

```
gparted
```

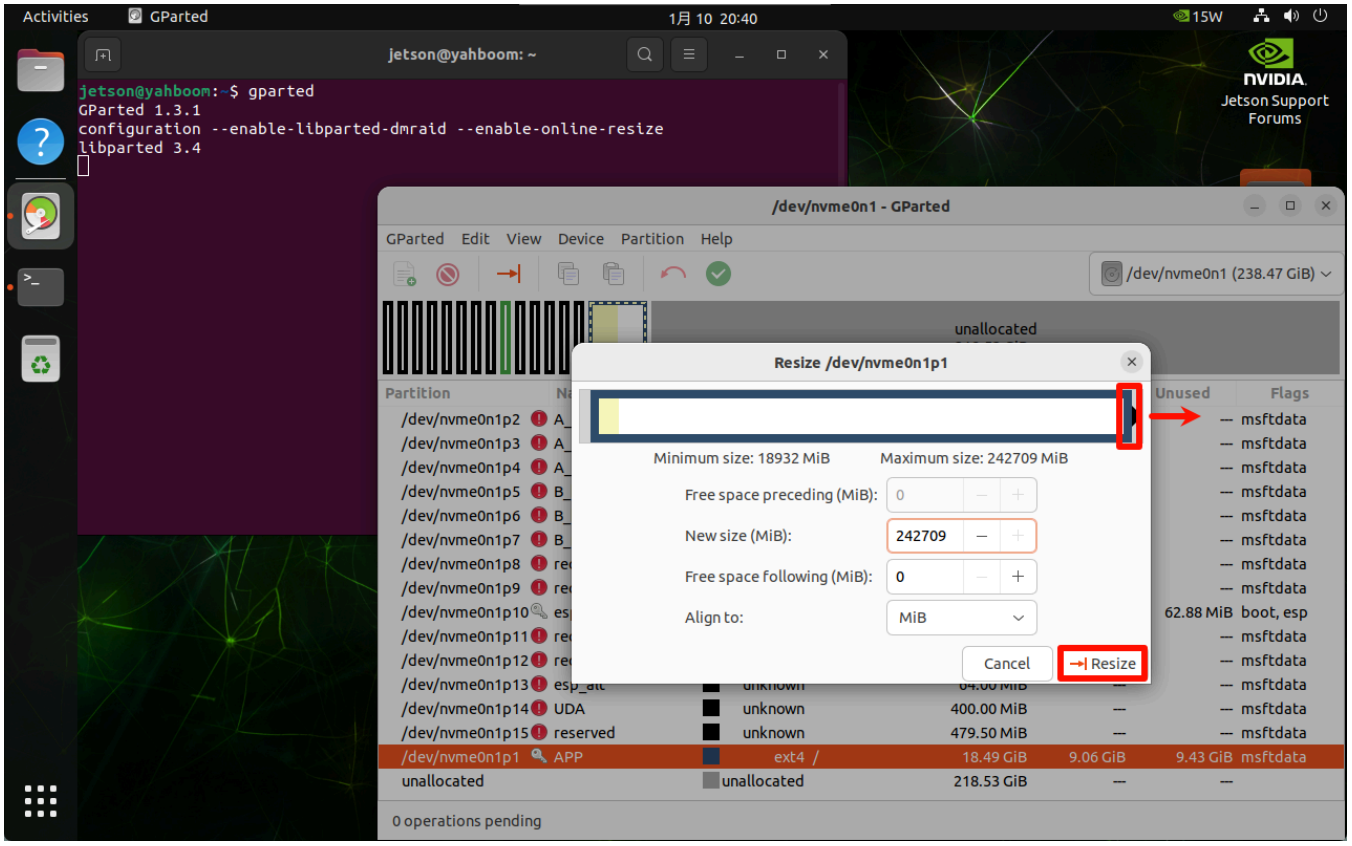

3. Adjust the partitions

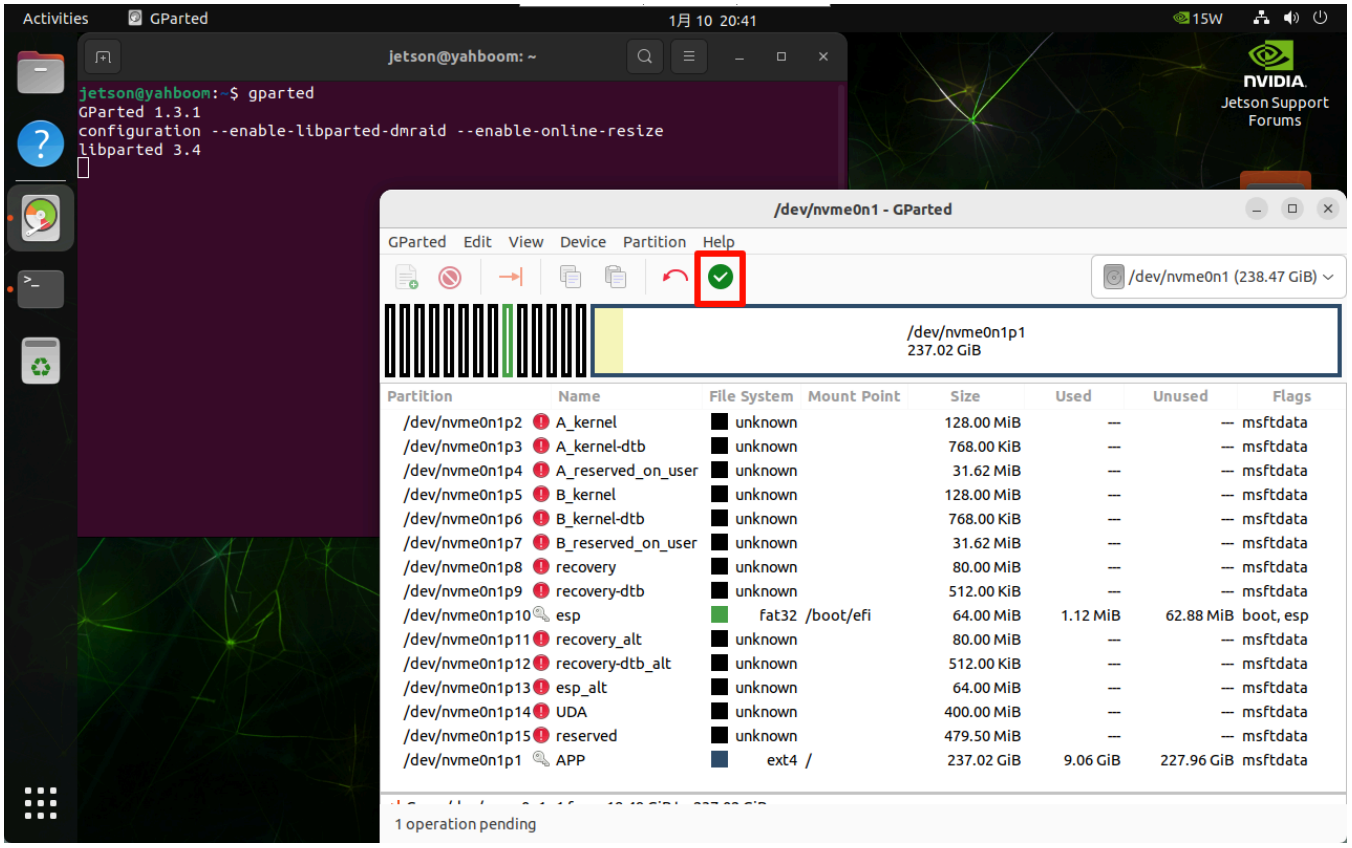

Right-click the disk partition that needs to be expanded: generally you should select the largest partition on the disk

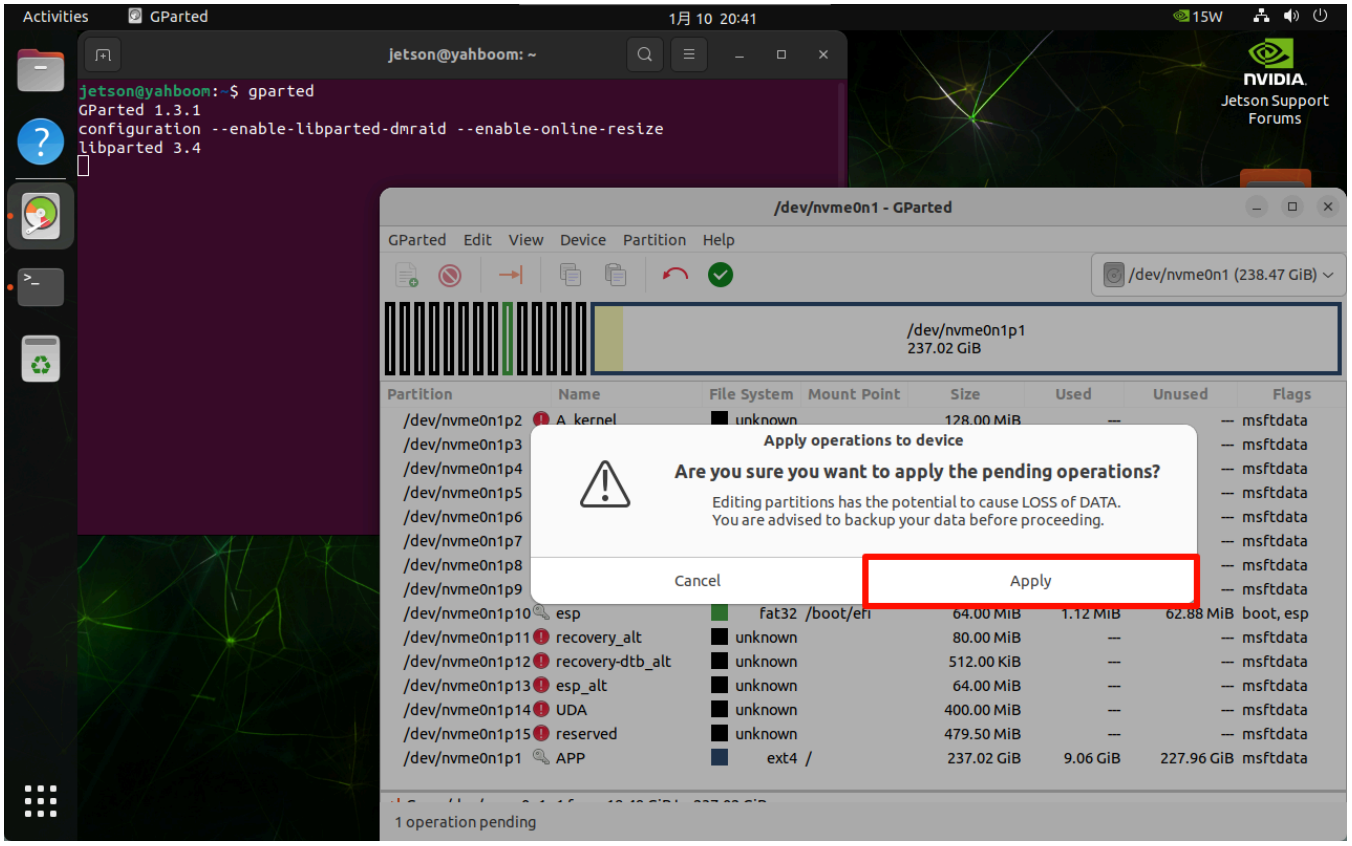

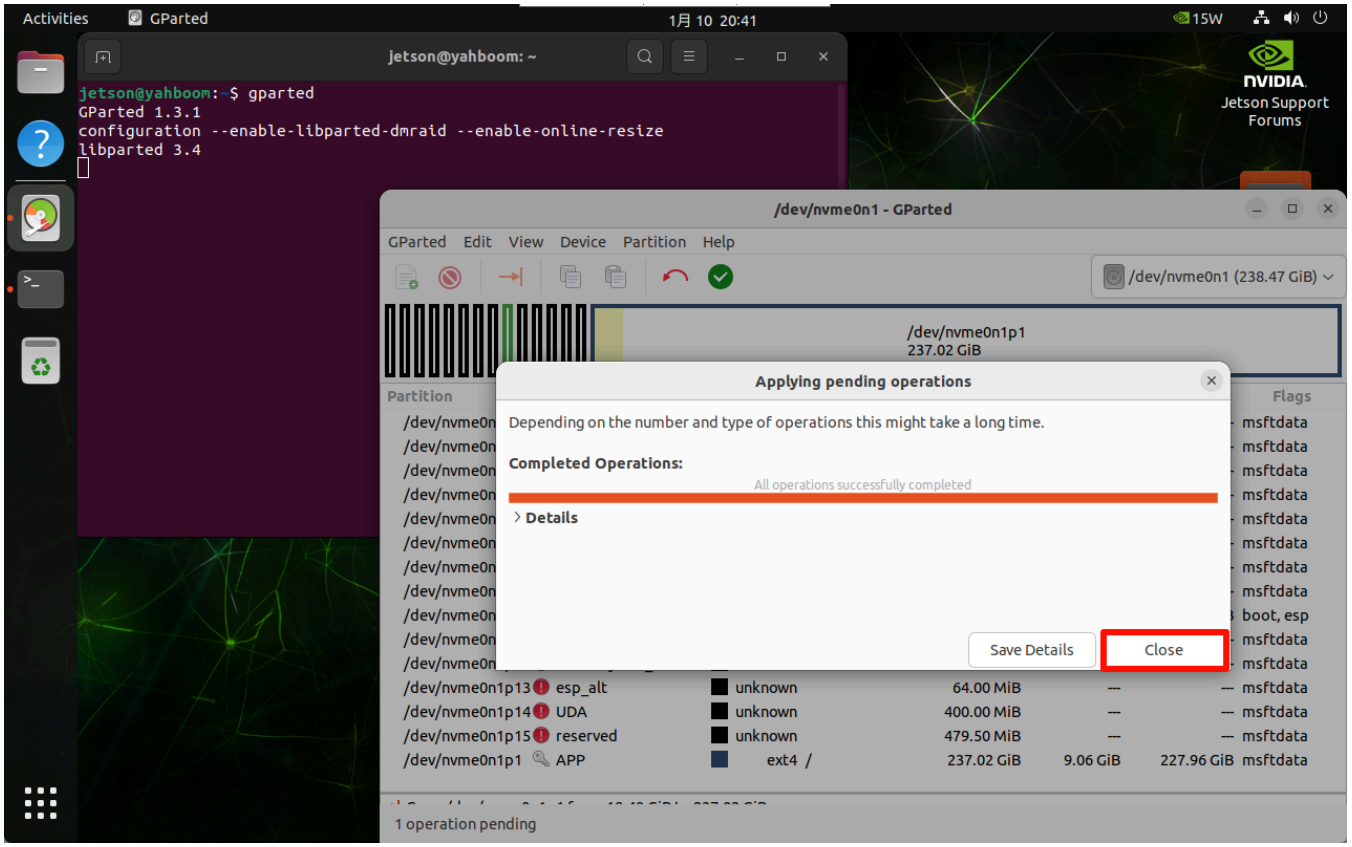

You can adjust the partition size with the slider: you can maximize the space and slide it all the way to the right

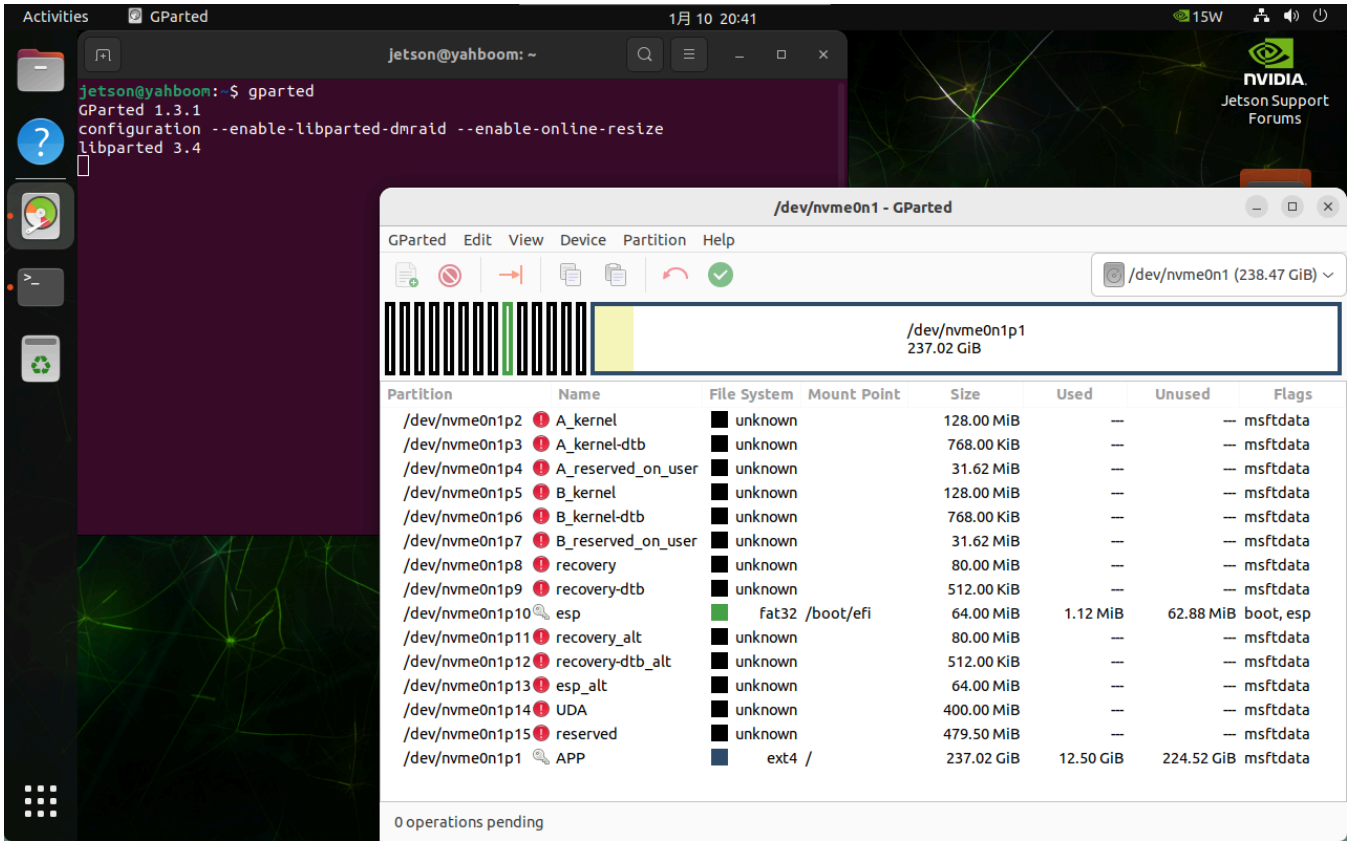

Confirm the partition adjustment operation:
