AR vision (USB)

AR vision (USB)
1. AR Vision
2. Preview of the Effect

1. AR Vision

AR (Augmented Reality) vision is a technology that overlays virtual information onto the real world.

An AR system has three prominent characteristics: ① the integration of information from the real world and the virtual world; ② real-time interactivity; ③ adding and positioning virtual objects in a three-dimensional space.

By using cameras, sensors and computer vision algorithms, an AR vision system can capture and analyse the real environment in real time and overlay the computer-generated images, text or other virtual content onto the real scene the user is looking at, thereby enhancing the perception and the interactive experience.

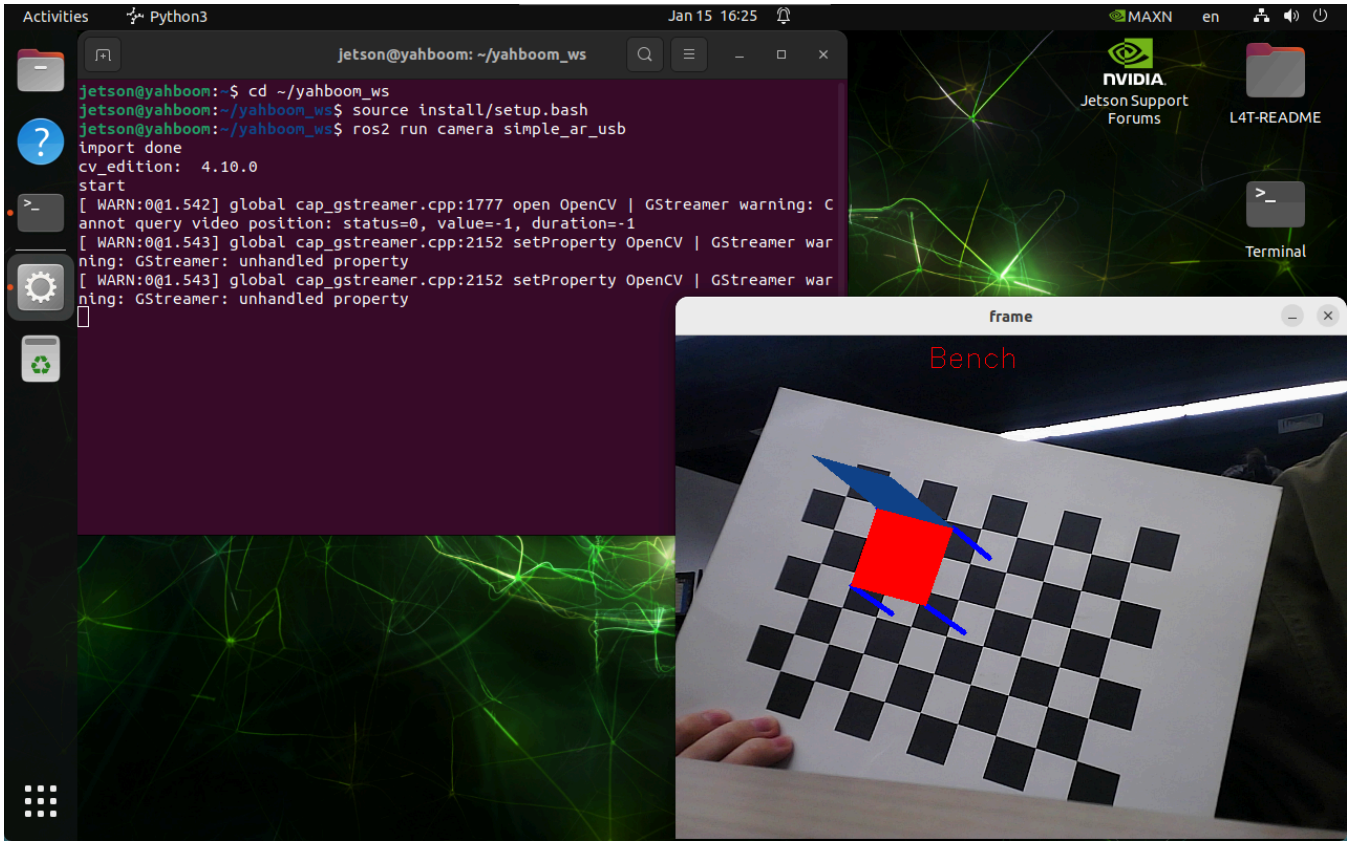

2. Preview of the Effect

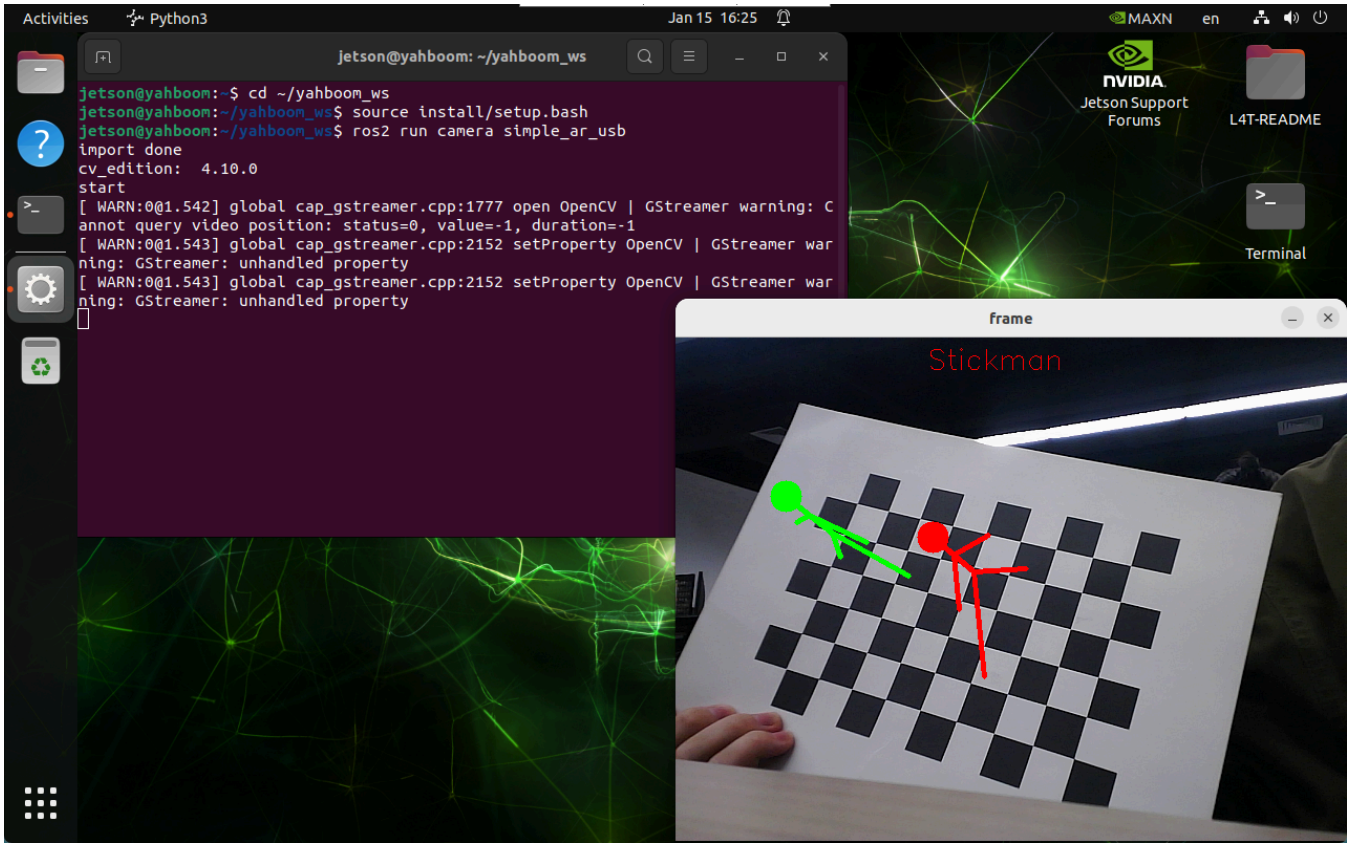

Click the preview window and press `f` to switch the virtual 3D object model.

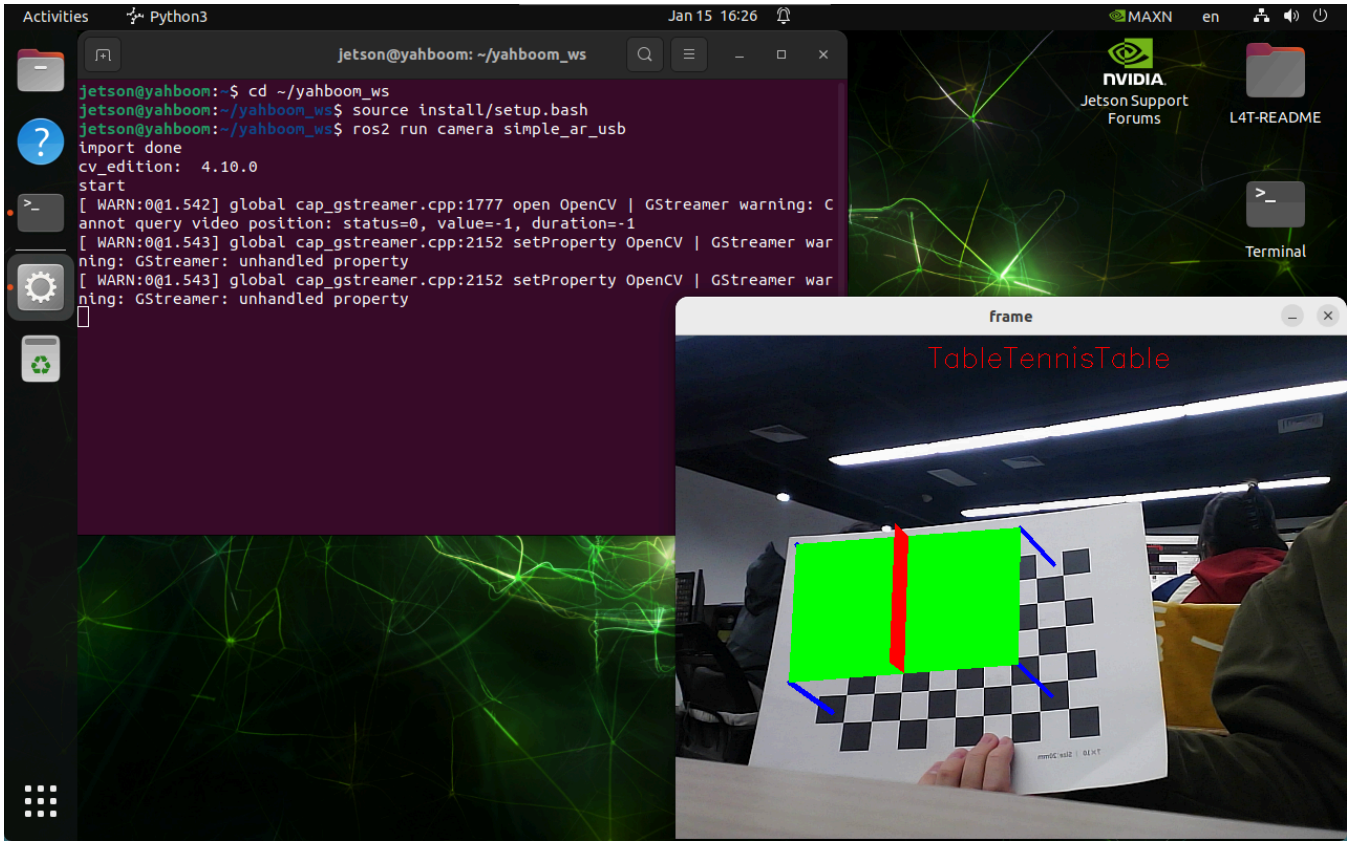

```
cd ~/yahboom_ws
```

```
source install/setup.bash
```

```
ros2 run camera simple_ar_usb
```
