Network configuration

Network configuration
1. WIFI mode
    1.1. Connect to WiFi
    1.2. View the WiFi information
    1.3. Set a static IP
2. Hotspot mode
    2.1. Create a hotspot
    2.2. Hotspot information

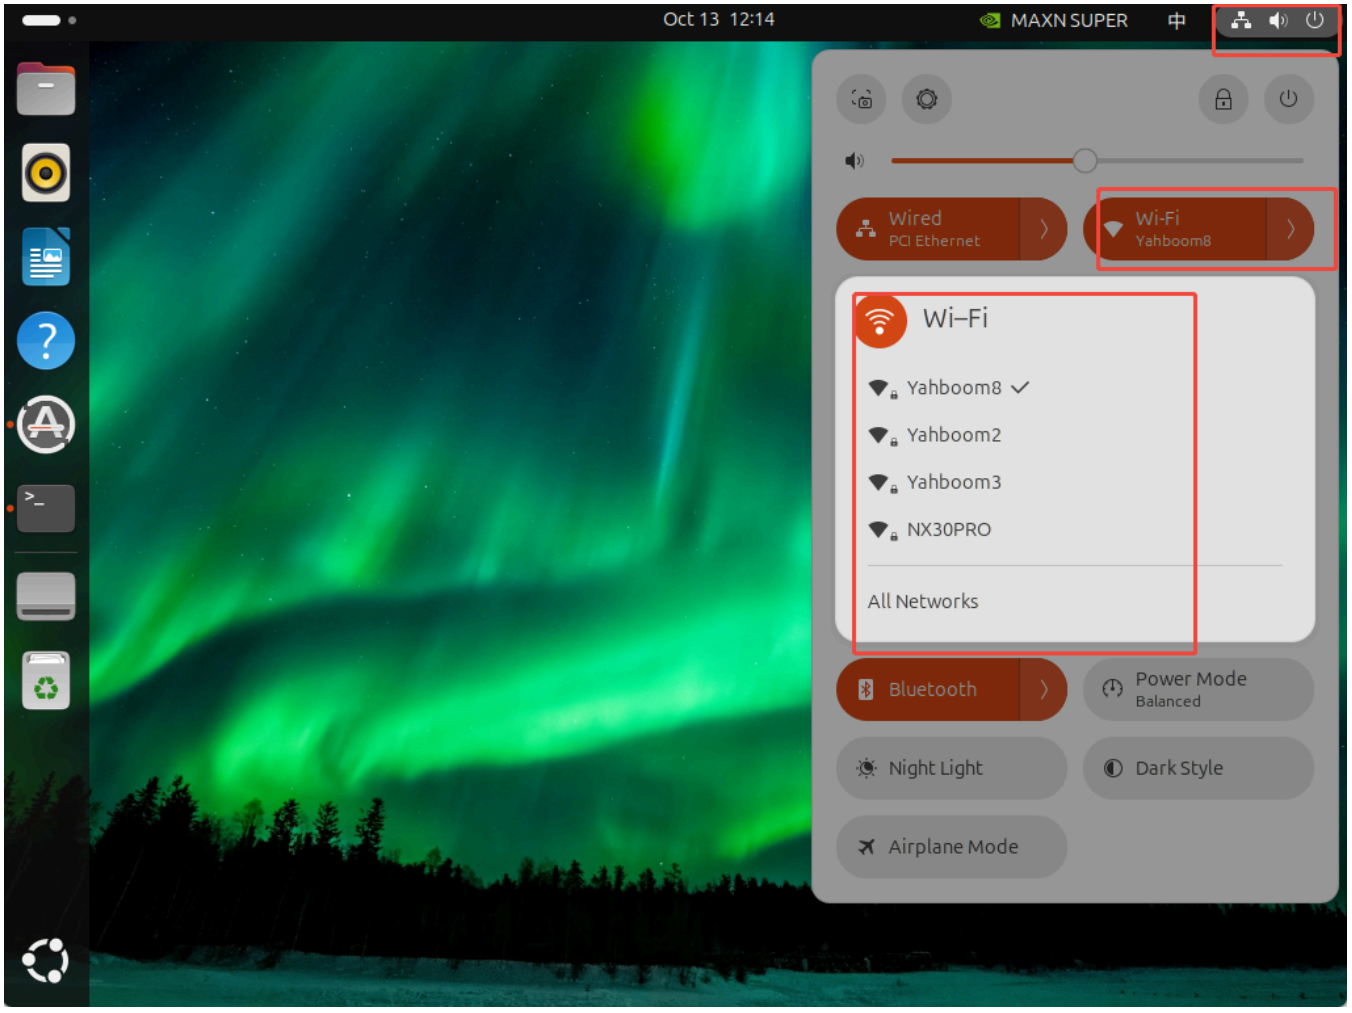

The WiFi and hotspot modes require a wireless network adapter; before making the settings below, check whether the wireless network adapter and the antennas have been installed!

```
It is recommended to switch networks with a display connected, because once the system switches to a new network, network sharing must be enabled again on the new network before VNC remote access can work
```

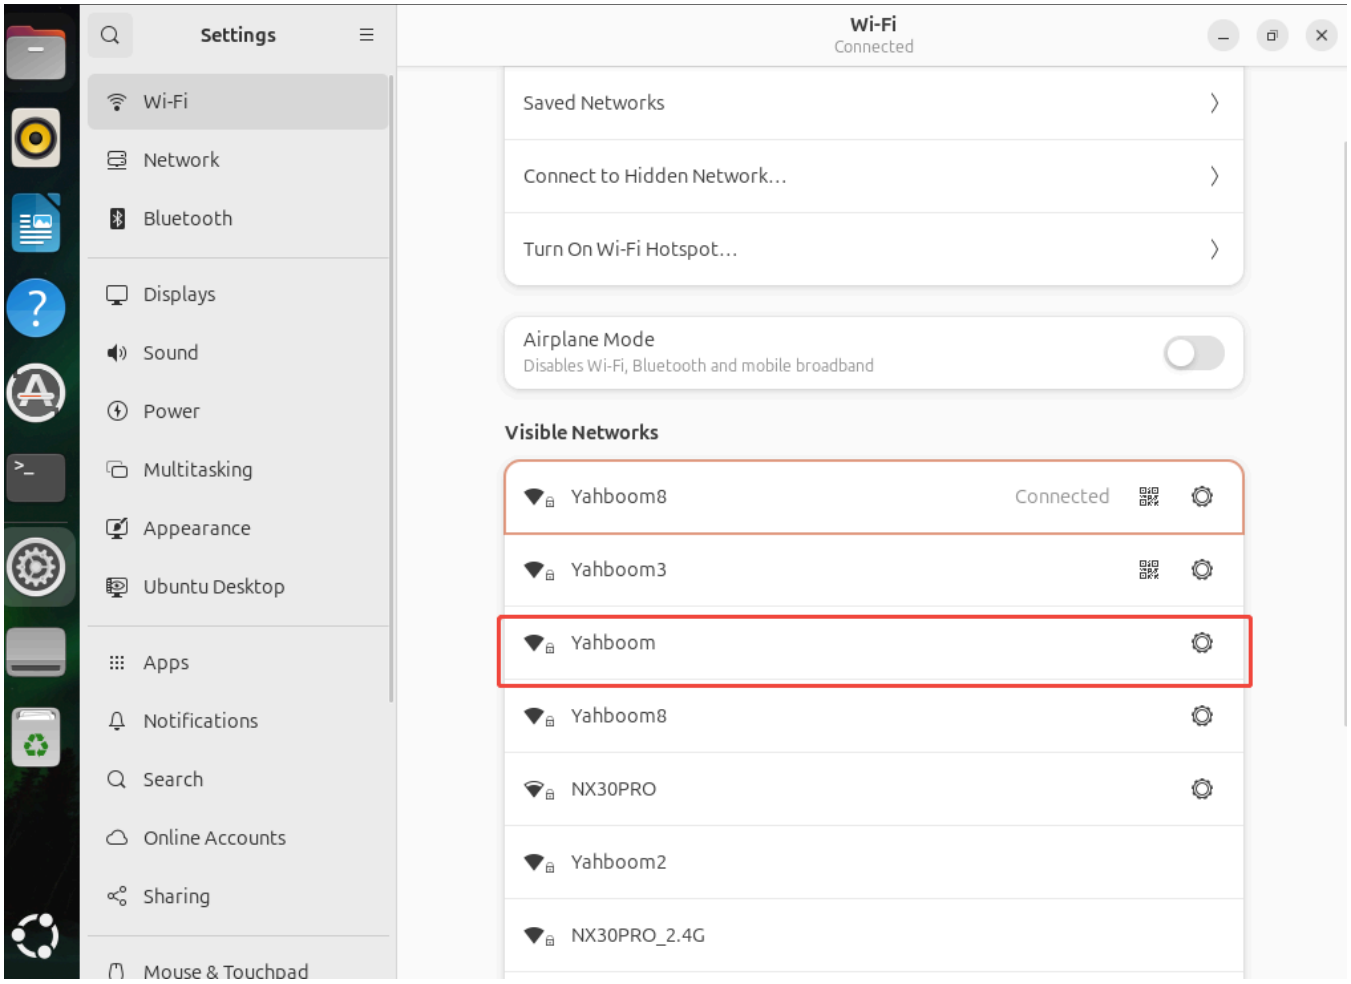

1. WIFI mode

1.1. Connect to WiFi

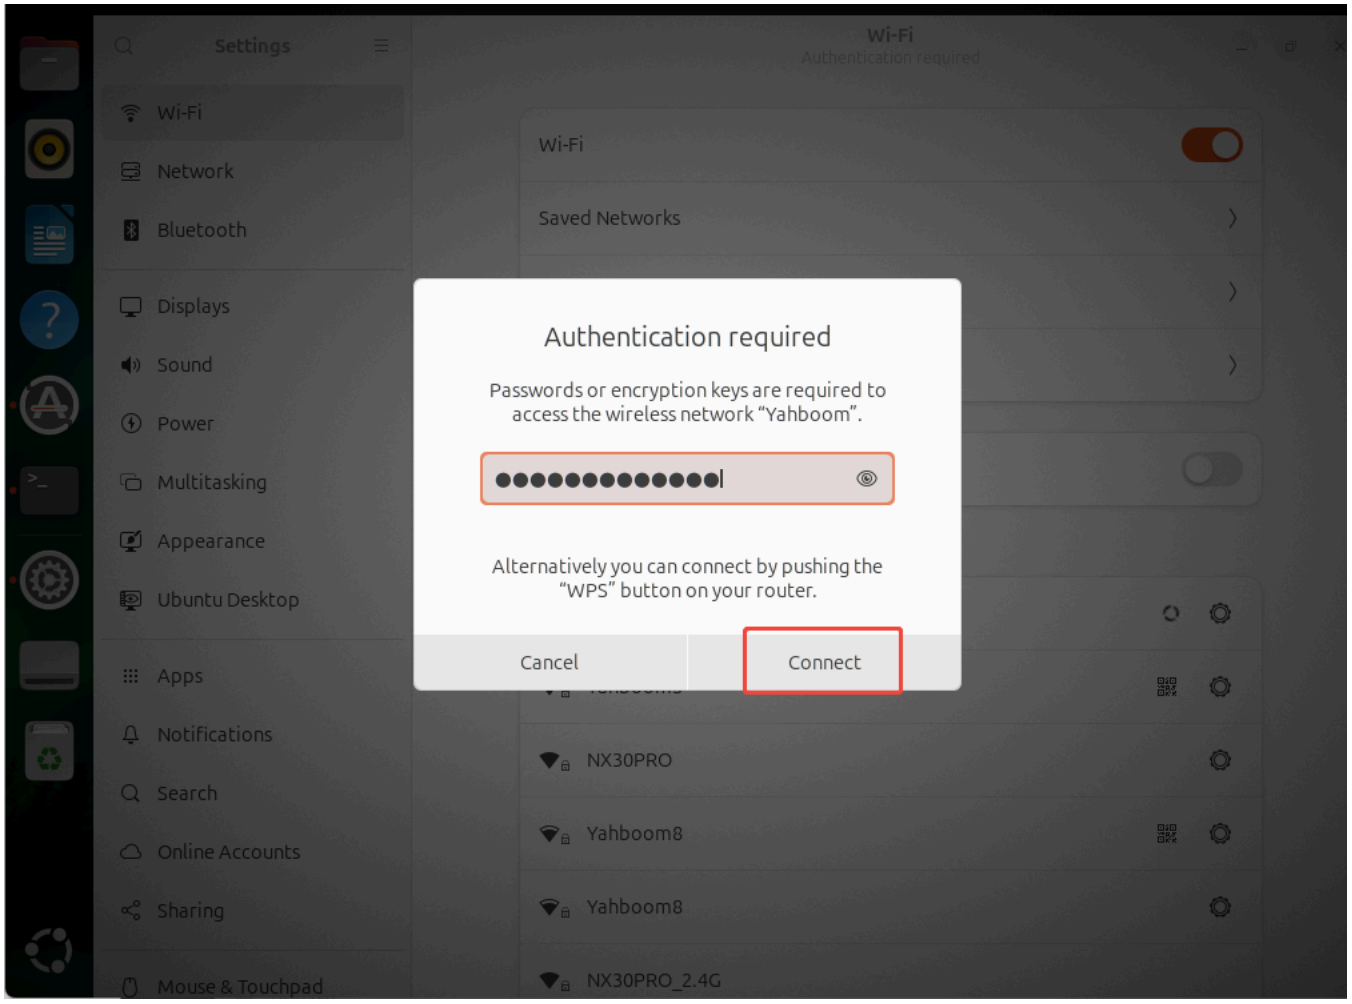

Select the menu option in the top right corner of the system desktop → WiFi option → Wi-Fi Settings:

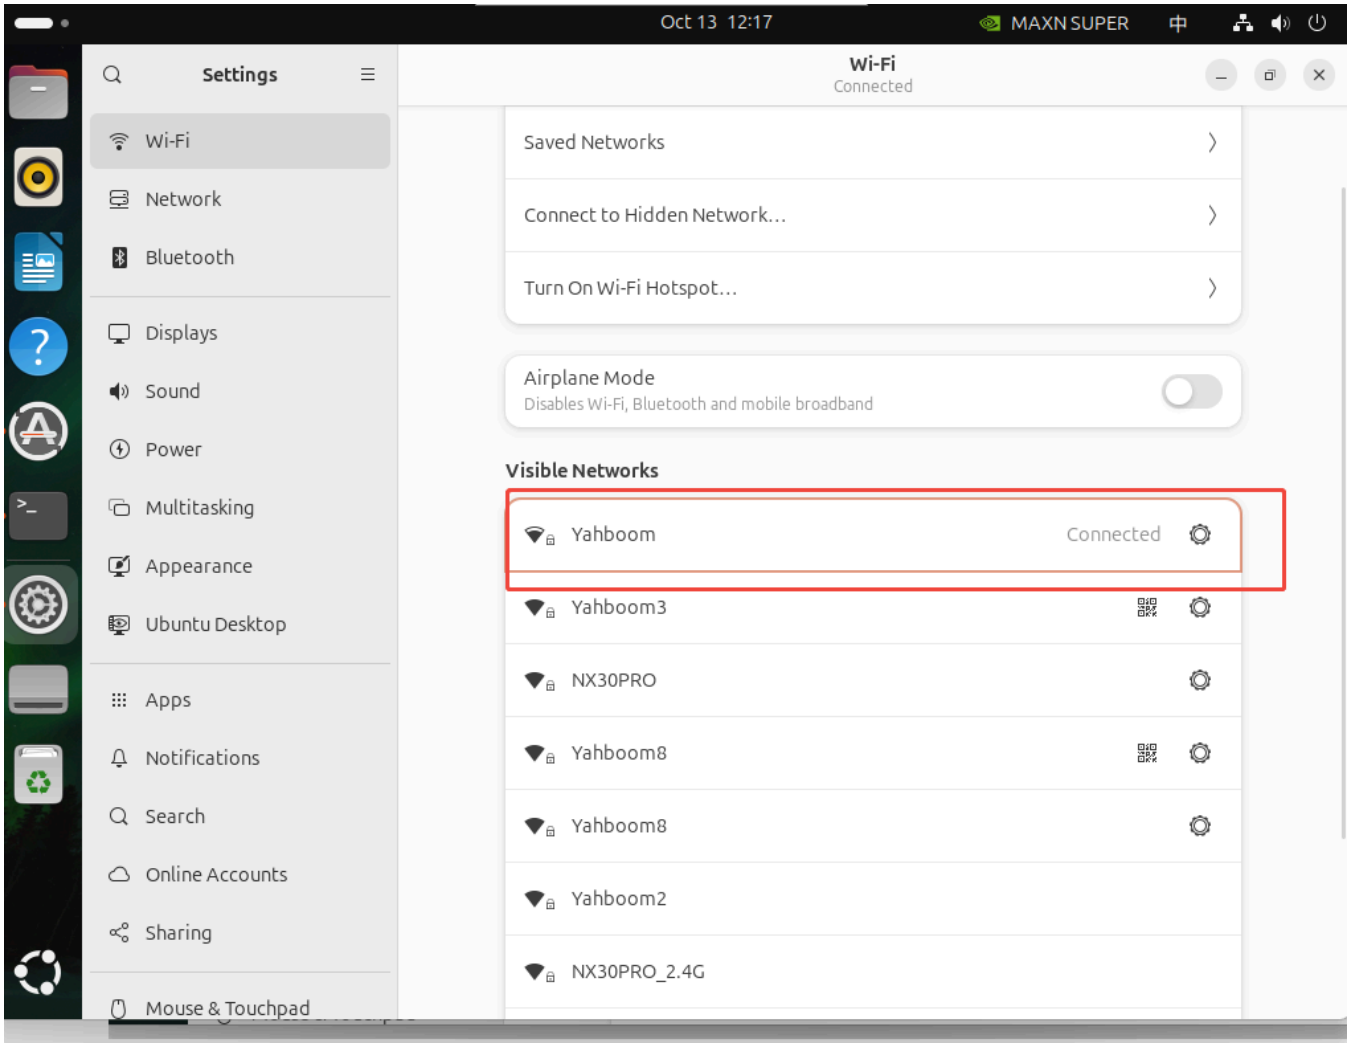

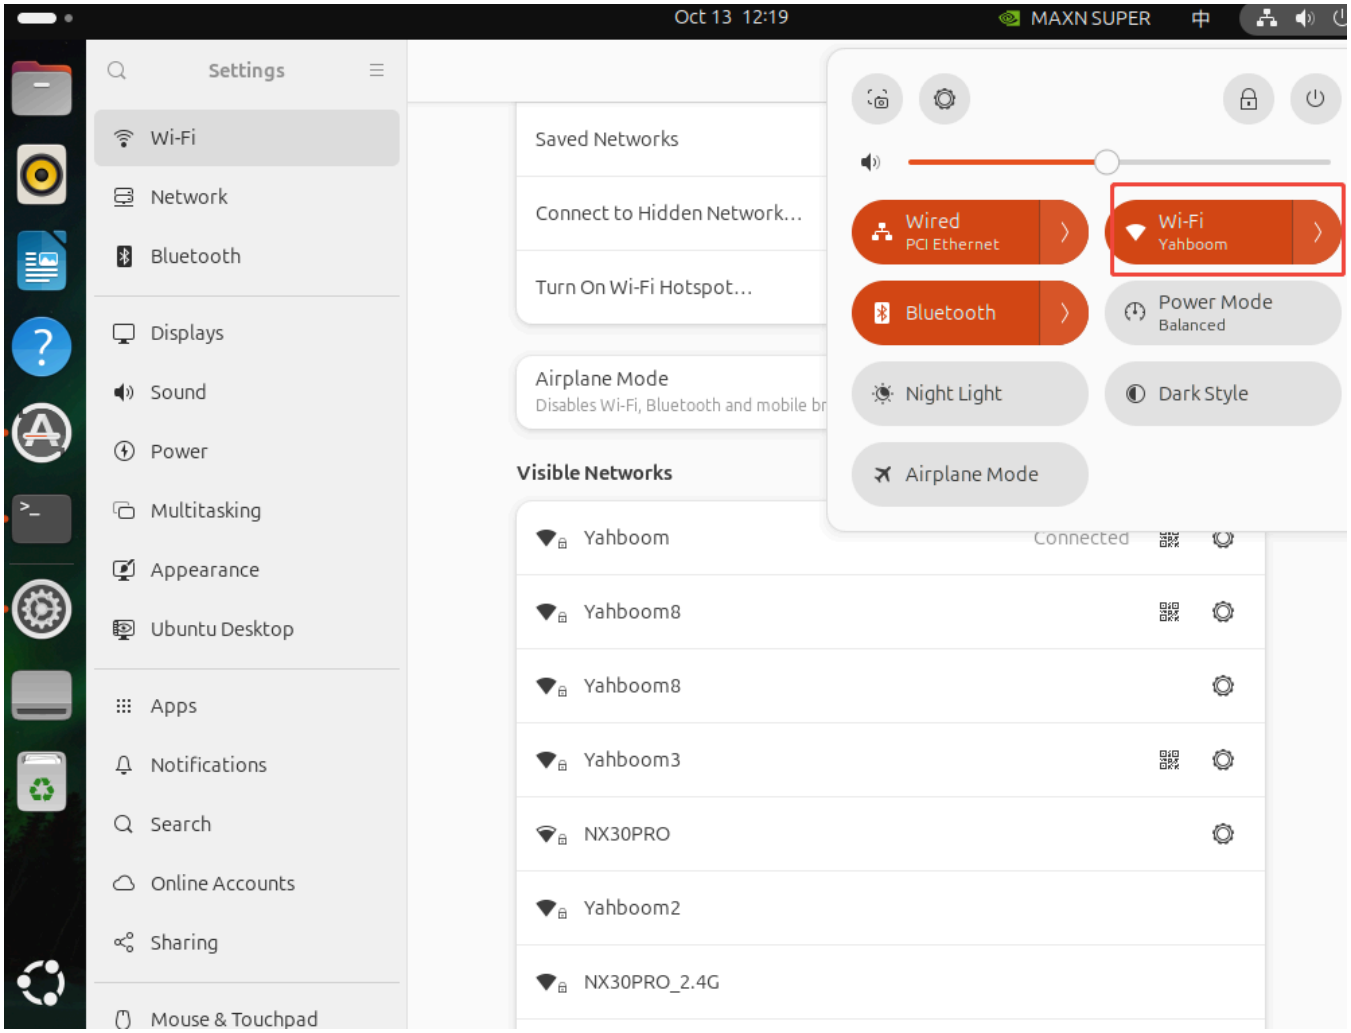

Select the WiFi network you want to connect to: if the WiFi signal is very weak, check whether the antennas are not installed or whether the surrounding environment has a poor signal

After entering the password, click Connect:

Passwords or encryption keys are required to access the wireless network “Yahboom”.
Alternatively you can connect by pushing the “WPS” button on your router.

1.2. View the WiFi information

Click the settings icon of the connected WiFi:

The following command can be used in the terminal to view the IP address of all the networks: `enP8p1s0` is the IP of the wired connection, and `wlP1p1s0` is the IP of the WiFi connection

```
ifconfig
```

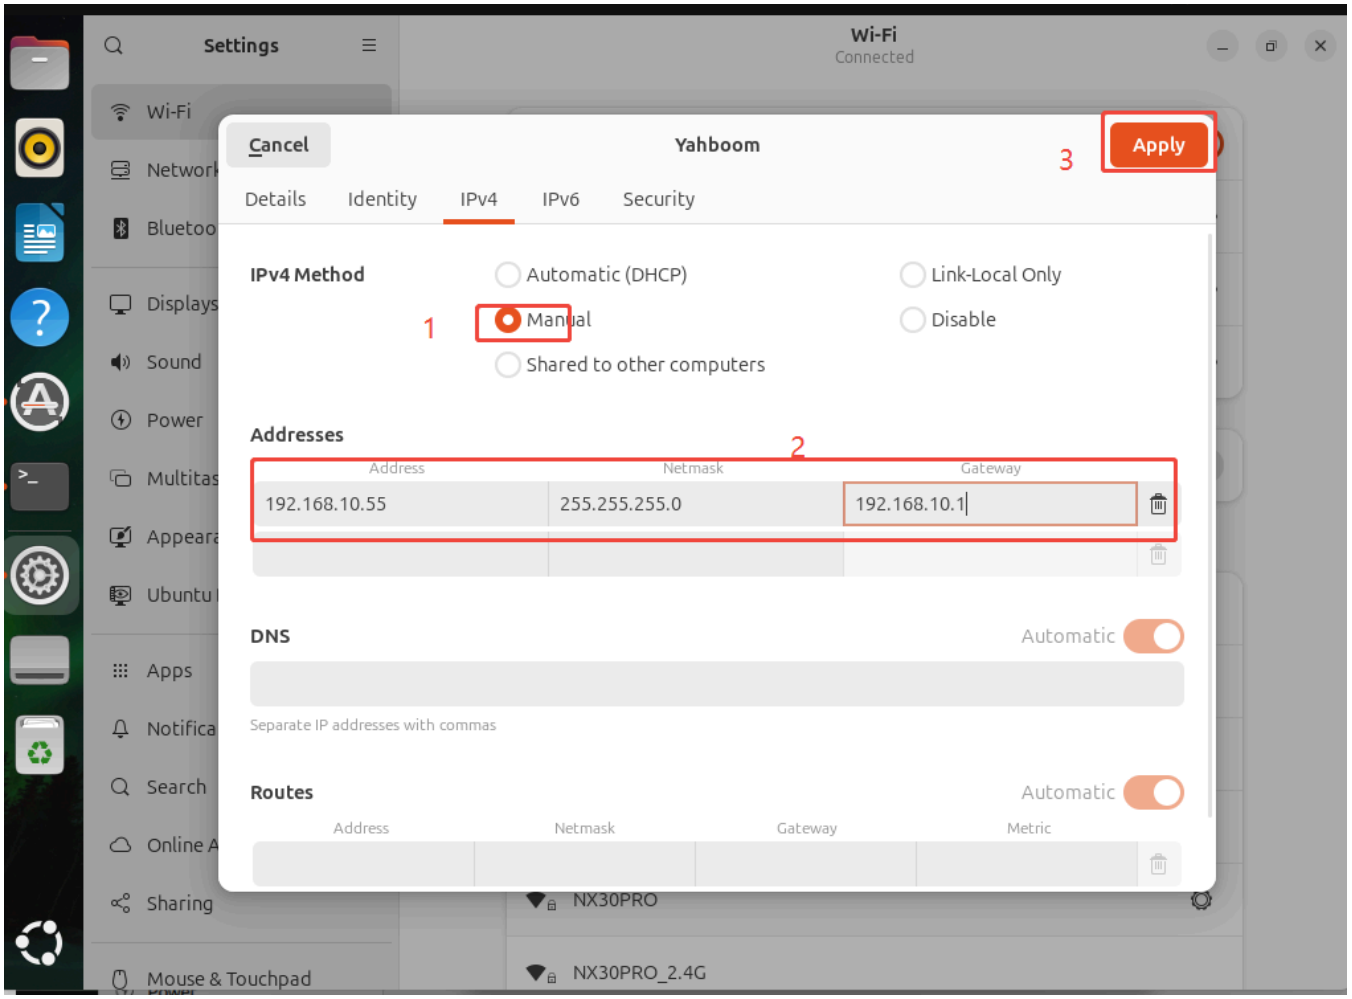

1.3. Set a static IP

Click the settings icon of the connected WiFi to modify the IPv4 options:

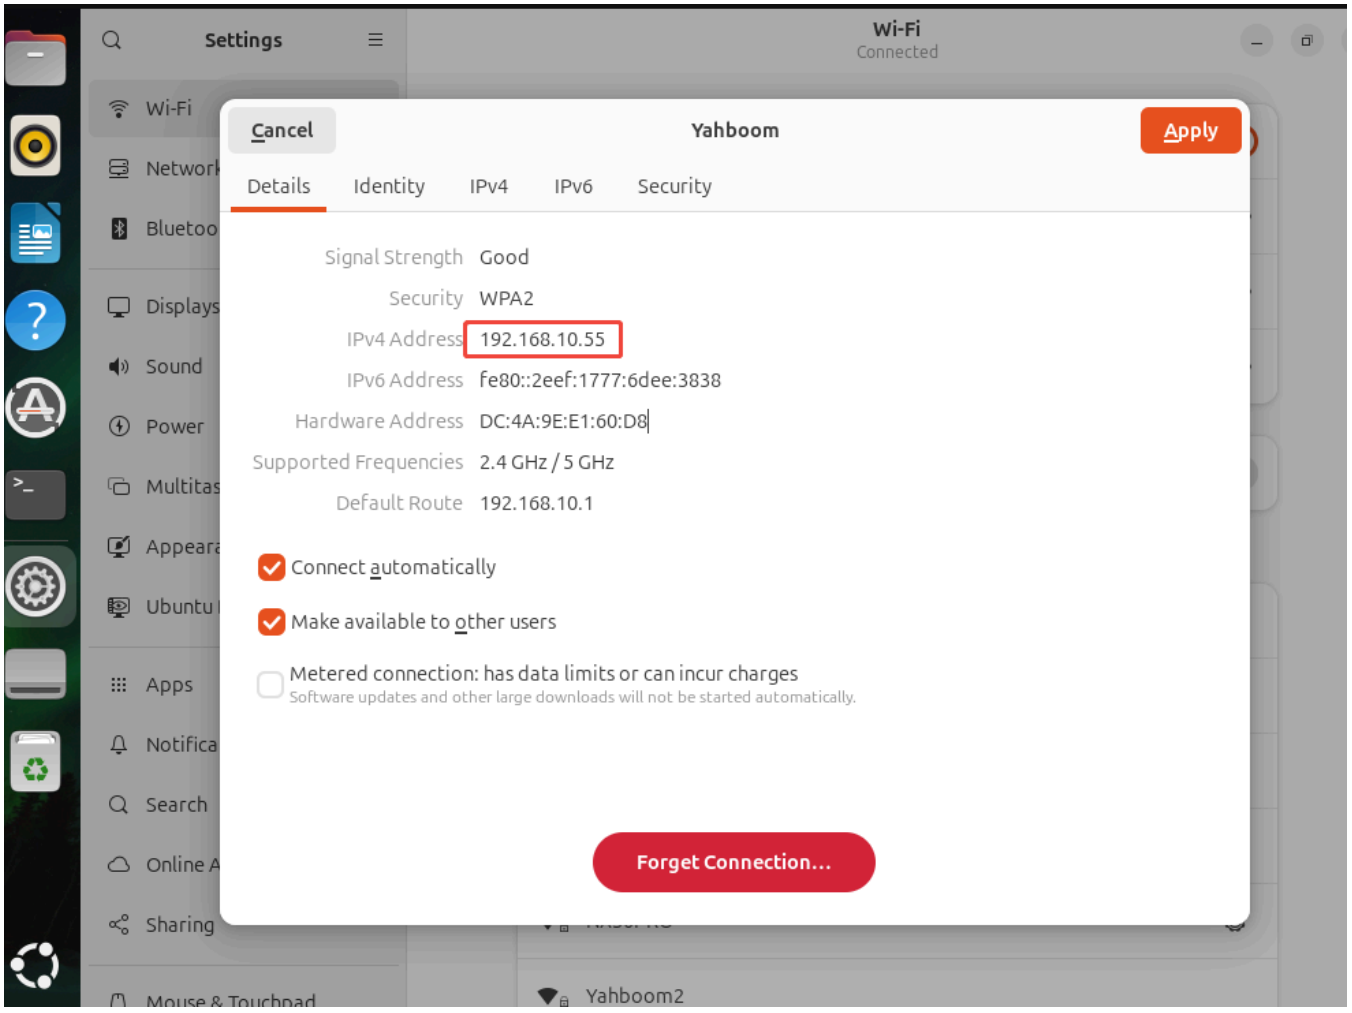

Address: fill in the IP address you want to fix, which must be within the assignable IP address range

Netmask: fill in 255.255.255.0

Gateway: fill in the default gateway address of the WiFi

After it is finished, reconnect to the WiFi to make the configuration take effect:

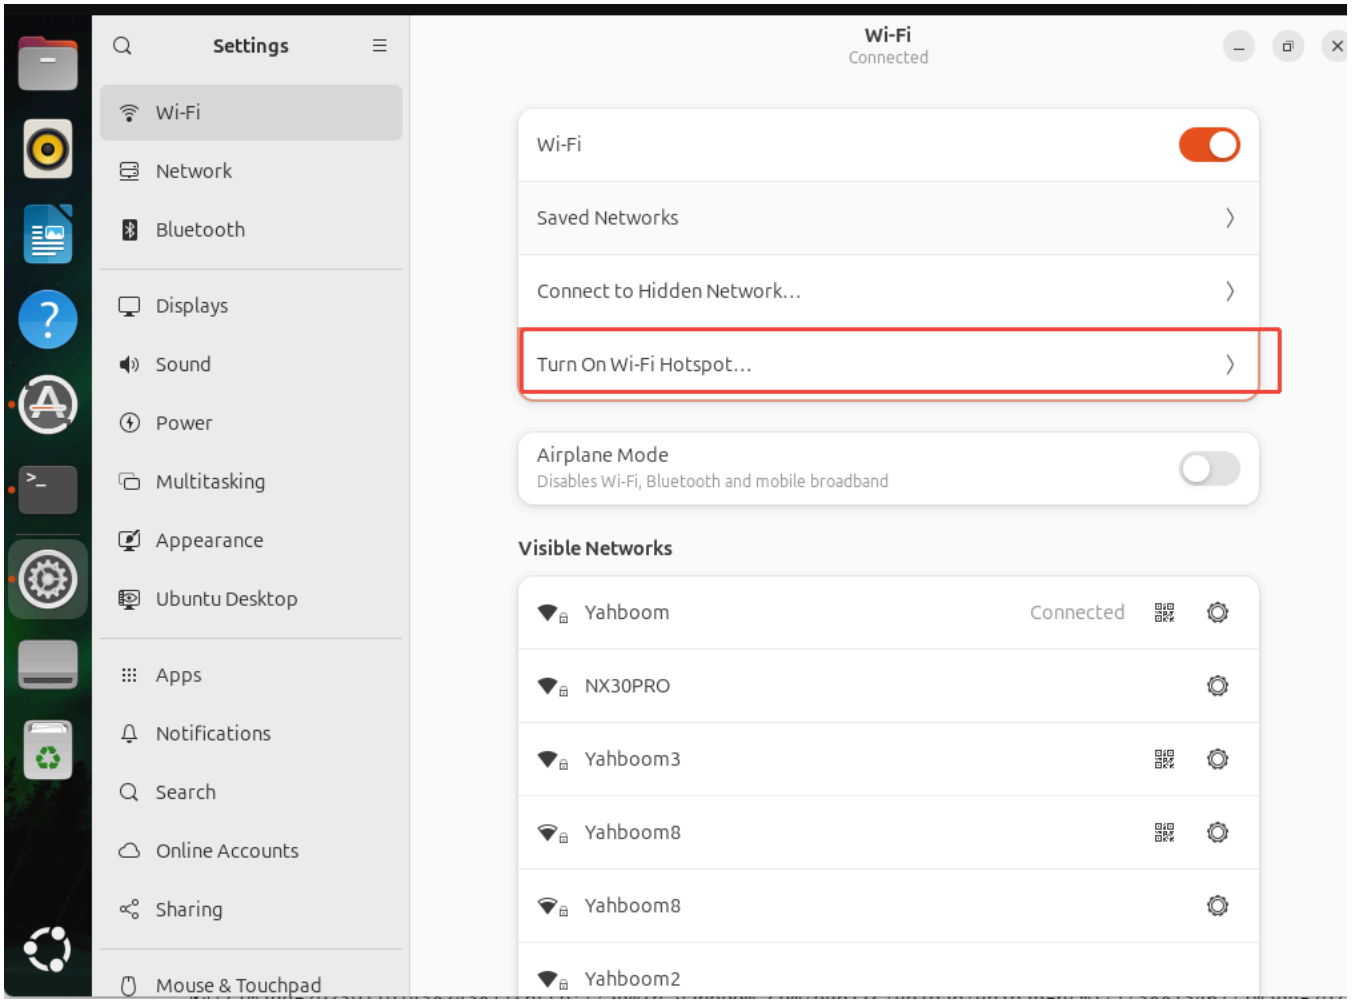

2. Hotspot mode

The wireless network adapter must support the hotspot before hotspot mode can be enabled.

```
The hotspot is configured in the desktop system and will be turned off automatically after the system restarts; users who need it can look for a tutorial on starting the hotspot automatically at boot on Ubuntu 24.04
```

2.1. Create a hotspot

Enter the WiFi settings and select `Turn On Wi-Fi Hotspot...`

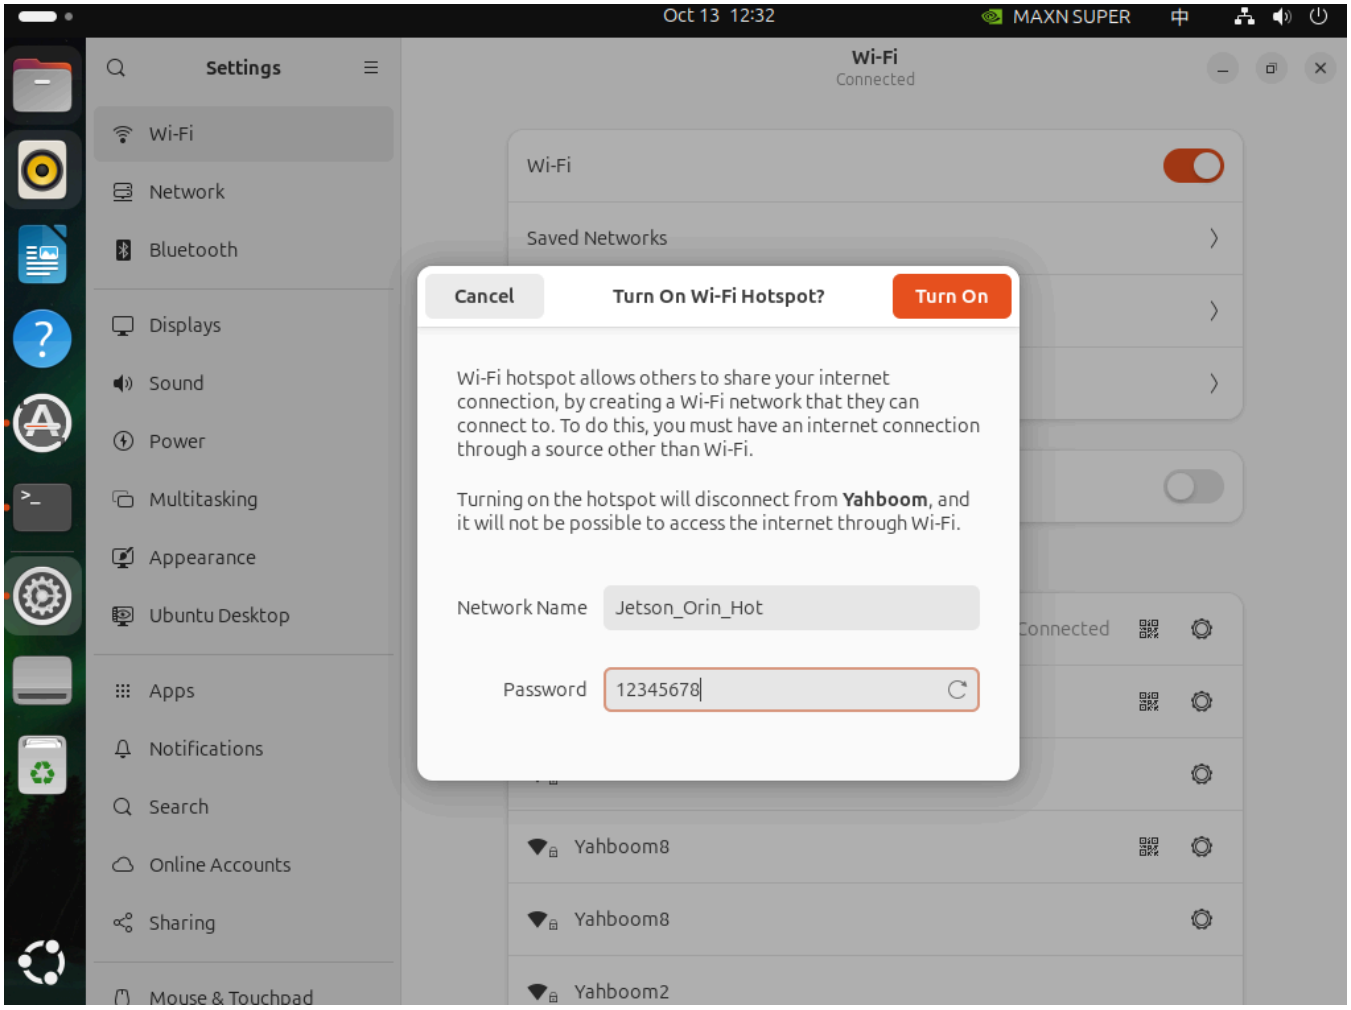

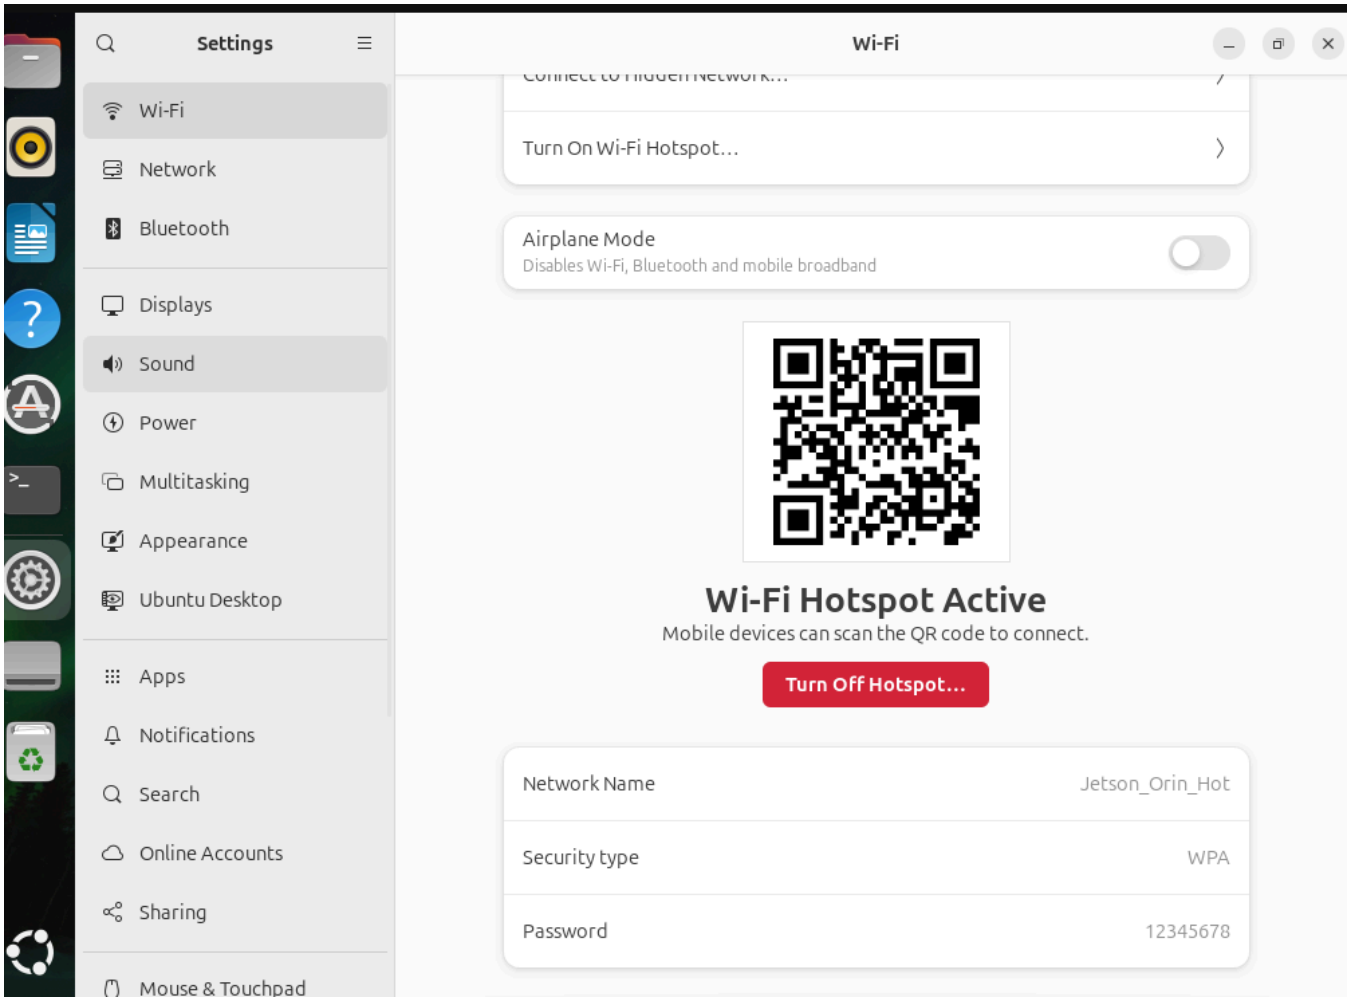

2.2. Hotspot information

Hotspot name: Jetson_Orin_Hot (can be customized)

Hotspot password: 12345678 (can be customized)

Default IP of the hotspot mode: 10.42.0.1

Turn On Wi-Fi Hotspot?
Turn On
Wi-Fi hotspot allows others to share your internet connection, by creating a Wi-Fi network that they can connect to. To do this, you must have an internet connection through a source other than Wi-Fi.
Turning on the hotspot will disconnect from Yahboom, and it will not be possible to access the internet through Wi-Fi.
