Mediapipe environment

Mediapipe environment

1. Install Mediapipe
2. Verify Mediapipe

Mediapipe is a cross-platform framework provided by Google, used to build multimodal (for example, image, audio, video, etc.) processing pipelines.

The factory image already comes with Mediapipe, so there is no need to install it again

1. Install Mediapipe

Install mediapipe with the pip command:

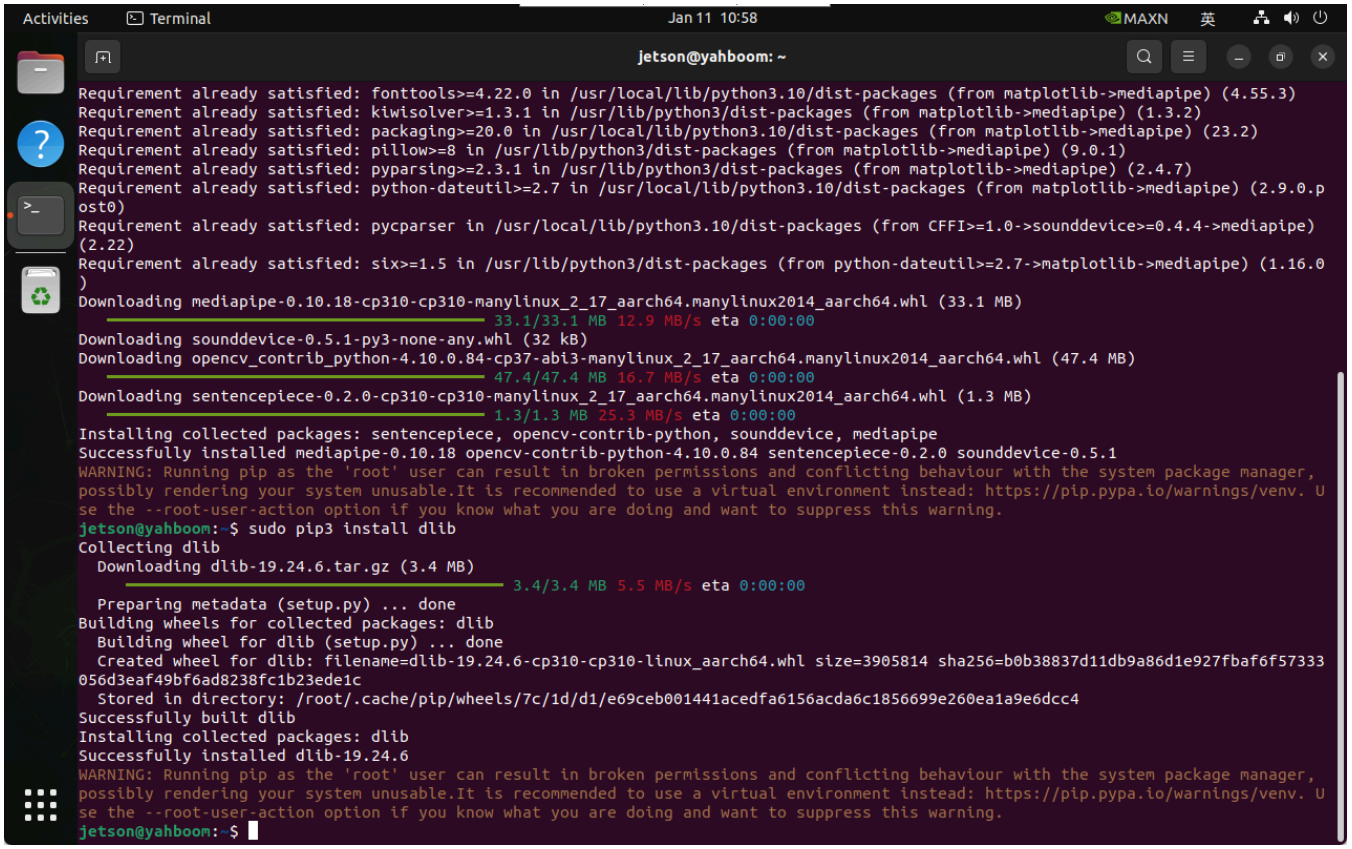

```
sudo pip3 install mediapipe --break-system-packages
```

Install OpenCV with the pip command:

```
sudo pip3 install opencv-python --break-system-packages
```

Install dlib with the pip command: some of the cases need this library

```
sudo pip3 install dlib --break-system-packages
```

2. Verify Mediapipe

```
python3 -c "import mediapipe as mp; print(f'Mediapipe version: {mp.__version__}')"
```
